

End-to-end checkout flow — **live on netwebmedia.com**, every screen captured.

Real test user, real production database, real Mercado Pago preapproval created. Walked through 10 distinct screens from the pricing page to the MP payment form. Found a production database bug mid-flow, fixed it, redeployed, re-ran — all documented here. Stopped before any credit card data was entered.

TEST USER	TEST EMAIL	PLAN TESTED	NATIVE CHARGE	SUBSCRIPTION ID CREATED

3

Highlight the button we're about to click FOR THE TUTORIAL

We test the cheapest paid tier — **AEO Starter \$249/mo**, `data-plan="cmo_starter"`. The script adds an orange outline to make the button unmissable in this tutorial. In real life this is just a clickable button.

SCREEN 3 Highlighted: `button[data-plan="cmo_starter"]` · the click handler at `pricing.html:1084` takes over from here

4

Click → bounced to register (because logged out) FRONTEND REDIRECT

The click handler checks `NWMApi.isAuthenticated()`, finds the user isn't logged in, and redirects to:

`/register.html?plan=cmo_starter&next=%2Fpricing.html%3Fcheckout%3Dcmo_starter`

The `next` param will be used after registration to auto-trigger the checkout.

SCREEN 4 Register page · empty form · "Free CRM Plan" badge top-right because `?plan=free` param is treated as default styling — but the next URL preserves our paid plan

5

Fill registration with test user

USER ACTION

Three fields + Terms checkbox: **Tutorial Tester** · `tutorial-test-2026-05-11@netwebmedia.com` · 22-character password · ☒ Terms accepted.

SCREEN 5 Form filled · "Create account" button now active (orange gradient)

6

Click Create account → success message

POST /API/AUTH/REGISTER · 200

The form calls `NwApi.register(email, password, name, honeypot, plan)`. The PHP API creates a row in `webmed6_nwm.users` with status `pending_payment` (per the access-control migration that ran earlier in this session), returns a 64-char auth token, and stores it in `localStorage`. The form shows the green "Account created — redirecting..." message and starts a 400ms timer to navigate.

SCREEN 6 Green success: "Account created — redirecting..." · token in `localStorage` · about to navigate to `/app/`

7

Land on the app shell dashboard

AUTHED · /APP/

Production app shell renders with welcome state. Bottom-left avatar shows "Tutorial Tester · User". Demo data fills the KPI cards (1,248 contacts, \$142.5k revenue) because this account hasn't started its own data yet.

SCREEN 7 App shell dashboard · "Welcome back, Tutorial. Here's your overview." · all CRM modules visible in left rail

Mid-flow: production bug found HTTP 500 · /API/BILLING/CHECKOUT

The next step in the script — POST to /api/billing/checkout — returned HTTP 500 with this database error:

```
{
  "status": 500,
  "body": {
    "error": "Database error: SQLSTATE[42S22]: Column not found: 1054
      Unknown column 'promo_code' in 'INSERT INTO'"
  }
}
```

BUG EVIDENCE From the page's perspective, nothing happened. From the API, every checkout call was failing 500. This had been broken in production for days/weeks.

Impact: Every paid plan checkout on netwebmedia.com was failing silently before this fix. Tutorial Tester is the first end-to-end test that surfaced it. The free plan signup (which doesn't touch this code path) was unaffected.

Root cause

The `subscriptions` table CREATE statement in `bl_ensure_schema()` (`api-php/routes/billing.php:582`) includes `promo_code`, `discount_pct`, and `discount_cycles` columns. But `CREATE TABLE IF NOT EXISTS` is a **no-op when the table already exists** — even if new columns have been added to the CREATE statement since the original create. The production database had the older table schema; the new columns were never backfilled.

The fix

Add three idempotent `ALTER TABLE` statements after the CREATE block. Each one is wrapped in try/catch with errno 1060 (Duplicate column) treated as a safe no-op — matching the pattern already used for the `users.status` migration directly above.

```
$coupon_cols = [
    ['promo_code',      "ALTER TABLE subscriptions ADD COLUMN promo_code VARCHAR(40) DEFAULT NULL AFTER mp_init_point"],
    ['discount_pct',    "ALTER TABLE subscriptions ADD COLUMN discount_pct TINYINT UNSIGNED DEFAULT 0 AFTER promo_code"],
    ['discount_cycles', "ALTER TABLE subscriptions ADD COLUMN discount_cycles TINYINT UNSIGNED DEFAULT 0 AFTER discount_pct"],
];
foreach ($coupon_cols as [$name, $sql]) {
    try { db()->exec($sql); }
    catch (PDOException $e) {
        if (strpos($e->getMessage(), '1060') === false) throw $e;
    }
}
```

Committed as `d86ceed83` → `8d454cea3` (post-rebase). Deployed via GitHub Actions in ~3 minutes.

After fix: First request to any `/api/billing/*` endpoint runs `bl_ensure_schema()`, the ALTER TABLEs run silently, and the next checkout INSERT succeeds. No downtime, no manual DB intervention required.

8

Returning-user login (for the rerun)

PUBLIC

To retry the checkout cleanly, we open a fresh browser context and log in as Tutorial Tester via the login page.

SCREEN 8 Login page · `/login.html` · "Sign in — Access your CMS & CRM workspace"

For the script: we authenticate via `POST /api/auth/login` directly from the page context (faster than driving the form).
Response:

```
{
  "status": 200,
  "body": {
    "ok": true,
    "user_email": "tutorial-test-2026-05-11@netwebmedia.com",
    "org_id": 1,
    "token_len": 64
  }
}
```

The 64-char token gets written to `localStorage.nwm_token` just like a normal login.

9

POST /api/billing/checkout → MP preapproval URL

HTTP 200 · SUBSCRIPTION_ID CREATED

With the auth token in `localStorage`, POST `/api/billing/checkout` with `{"plan_code": "cmo_starter"}`. The server creates a `subscriptions` row (id 8, status pending), calls the Mercado Pago Preapproval API with the org's email + plan amount, and returns the MP `init_point` URL.

```
{
  "status": 200,
  "body": {
    "subscription_id": 8,
    "flow": "preapproval",
    "mp_id": "dd0bd6168d384d70aa2722151ca646fd",
    "init_point": "https://www.mercadopago.cl/subscriptions/checkout?preapproval_id=dd0bd6168d384d70aa2722151ca646fd",
    "note": null
  }
}
```

```
}  
}
```

The `flow: "preapproval"` means MP is creating a recurring-billing authorization (vs. a one-time Checkout Pro preference, which is used for amounts > CLP 350,000 in test mode).

10

Browser redirected to Mercado Pago checkout

<https://www.mercadopago.cl/subscriptions/checkout/...>

Navigating to `init_point` takes the browser through an MP redirect chain to:

<https://www.mercadopago.cl/checkout/v1/subscription/redirect/.../payment-option-form/?preference-id=50023008-add2739e-...>

The MP payment form renders with our subscription details on the right side:

SCREEN 10 · THE PAYOFF Mercado Pago checkout · "¿Cómo quieres pagar?" · two payment paths · subscription detail: **NetWebMedia AEO Starter plan · \$237.000 CLP**

This is where the real flow stops in this tutorial. In production, a real buyer would click either "Ingresar con mi cuenta" (existing MP user) or "Tarjeta · Crédito o débito" (one-time card capture), authorize the recurring charge, and be redirected back to https://netwebmedia.com/crm/?billing=return&preapproval_id=... where the CRM frontend confirms the subscription.

What the buyer sees in detail

UI element	What it shows / does
"¿Cómo quieres pagar?"	Page heading · "How do you want to pay?"
"Ingresar con mi cuenta"	For existing Mercado Pago users · 1-click recurring authorization
"Tarjeta · Crédito o débito"	Capture card data for first-time MP users · authorizes recurring
"Detalle de tu suscripción"	NetWebMedia AEO Starter plan · \$237.000 CLP (= ~\$249 USD at 950 CLP/USD)

UI element	What it shows / does
"Procesado por Mercado Pago"	MP brand footer · LATAM-native trust signal

Part 2 — testing the second MP flow (Checkout Pro)

Mercado Pago has two checkout flows. CMO Starter at \$249 fits within the CLP 350k preapproval cap, so it uses the recurring preapproval flow. Anything above that hits Checkout Pro — and we wanted to capture that flow too.

The two flows side by side

Dimension	Preapproval flow	Checkout Pro flow
Triggered by	CLP ≤ 350,000 (~USD 368)	CLP > 350,000
Plans in scope	cmo_starter (\$249), crm_starter (\$49), crm_pro (\$249), agent_starter (\$99), social_starter (\$297)	cmo_growth (\$999), seo_pro (\$997), ads_pro (\$997), all video/ad/seo tiers
API response flow	"preapproval"	"one_time_checkout_pro"
MP URL pattern	/subscriptions/checkout?preapproval_id=...	/checkout/v1/redirect?pref_id=...
What MP shows	"Detalle de tu suscripción" monthly recurring price	"Detalles del pago" setup + month 1 = one-time amount
Recurring billing	✓ Auto-charged monthly by MP	X Manual invoices for month 2+ (per the API note)
Buyer payment splits	Single source	Can split across 2 cards (visible in MP UI)
Test-mode reason	—	Production MP keys would lift the cap and enable recurring

Why the dual flow exists: In MP TEST mode, recurring preapprovals are capped at CLP 350,000. Plans above that fall back to one-time Checkout Pro. The note field in the checkout response makes the cost clear: *"One-time charge covers setup + first month. Monthly invoices for month 2+ sent by email. Upgrade to production MP keys to switch to auto-recurring."*

Bug #2 found — pricing.html SKU mismatch HTTP 400 · "UNKNOWN PLAN"

Our first attempt to test CMO Standard used plan_code: "cmo_standard" (matching the data-plan attribute on the "Start Standard — \$1,490/mo →" button at pricing.html:441). Response:

```
{
  "status": 400,
  "body": { "error": "Unknown plan" }
}
```

Every click on that button hits this 400 error. The CMO Standard \$1,490/mo button is currently broken in production.

Root cause: The catalog in api-php/routes/billing.php:317-353 defines four CMO plans — **cmo_starter (\$249)**, **cmo_growth (\$999)**, **cmo_scale (\$2,499)**, **cmo_enterprise (\$5,999)**. There is no cmo_standard . There is no \$1,490 CMO plan at all.

The pricing-vs-catalog mismatch in one table

Pricing page label	data-plan code	Catalog plan	Catalog price	Status
"Start AEO Starter — \$249/mo →"	cmo_starter	AEO Starter	\$249	✅ matches
"Start Standard — \$1,490/mo →"	cmo_standard	does not exist	—	❌ 400 error
(catalog only) CMO Growth	cmo_growth	CMO Growth ⭐ most popular	\$999	✅ works via dynamic grid
(catalog only) CMO Scale	cmo_scale	CMO Scale	\$2,499	needs_contact=true (blocked)
"Apply for Premium →"	—	cmo_enterprise (via contact page)	\$5,999	✅ contact-sales path

Strategic decision needed

This is not a "fix the bug" situation — it's a strategic alignment question. Two paths forward:

Option A — Update marketing

Change `pricing.html` button to `data-plan="cmo_growth"` + label "Start Growth — \$999/mo →". Aligns the public site to the actual product catalog. **Downside:** the "\$1,490 CMO Standard" price point is baked into every sales simulation, proposal template, engagement letter, and onboarding guide in `docs/`. Those would need updating.

Option B — Update catalog

Add a `cmo_standard` plan to `bl_plans_seed()` at \$1,490 between `cmo_growth` and `cmo_scale`. Matches every existing marketing material + sales doc. **This is what the marketing materials assume exists.**

Recommendation: Option B. The \$1,490 "CMO Standard" price point is referenced across:

- `services.html` — CMO Standard pricing card
- `pricing.html` — the hardcoded "Start Standard \$1,490/mo" button
- `docs/sales-management-simulation/` — Sarah Test's \$17,880 year-1 deal
- `docs/sales-simulation-cmo-premium/` — references "CMO Standard \$1,490/mo" as the prior tier
- `docs/client-onboarding-guide*/` — both editions assume \$1,490
- `email-templates/` — niche plan emails reference \$1,490 tier

The catalog is the outlier. Adding `cmo_standard` at \$1,490 brings the system into alignment with everything else.

I did not auto-fix this one because it's a strategic question — both the price and the plan name should match Carlos's intent, not my inference.

15

Workaround used for this tutorial: cmo_growth (\$999)

Since `cmo_standard` doesn't exist, we substituted `cmo_growth` (\$999/mo) — the next-tier real plan that triggers Checkout Pro.

The screenshot shows the NetWebMedia website. The top navigation bar includes links for About, Services, Industries, Partners, Blog, Q&A, Help, Contact, and Login, along with a 'Get the 48-Hour Audit' button. The main content area is divided into three columns for SEO services: Starter, Pro, and Max. Each column lists features and includes a 'Start with' button. Below this is a 'Paid Ads Management' section with three plans: Starter, Pro, and Max, each with a price and features. A chat bubble is visible on the left, and a WhatsApp icon is on the right.

- ✓ Dedicated ads strategist

SCREEN 15 Pricing page · the puppeteer script tried to scroll to `button[data-plan="cmo_growth"]` which doesn't exist as hardcoded — the page scrolled to the Paid Ads section instead. Useful as evidence that hardcoded plan buttons only cover Starter + Standard tiers.

16

POST /api/billing/checkout with cmo_growth → Checkout Pro init_point

HTTP 200 · FLOW: ONE_TIME_CHECKOUT_PRO

Same auth flow as Part 1 (Tutorial Tester logs in via API). POST /api/billing/checkout with `{"plan_code":"cmo_growth"}`. Response:

```
{
  "status": 200,
  "body": {
    "subscription_id": 9,
    "flow": "one_time_checkout_pro",
    "mp_id": "50023008-6cb1d63f-5ad2-4cd5-9405-103bff48f61d",
    "init_point": "https://www.mercadopago.cl/checkout/v1/redirect?pref_id=50023008-6cb1d63f-5ad2-4cd5-9405-103bff48f61d",
    "note": "One-time charge covers setup + first month. Monthly invoices for month 2+ sent by email. Upgrade to production MP keys to switch to auto"
  }
}
```

Two things to notice:

- `flow: "one_time_checkout_pro"` — different from the `preapproval` flow we got for `cmo_starter`
- `mp_id` prefix `50023008-` — that's MP's preference-ID format (vs. the 32-char preapproval ID format `dd0bd616...` we got in P

17

Mercado Pago Checkout Pro page rendered DIFFERENT UI FROM PREAPPROVAL FLOW

Browser redirects through MP's preference-ID chain to a Checkout Pro payment-option-form. UI differs in 4 ways from the preapproval flow:

SCREEN 16 · CHECKOUT PRO MP Checkout Pro · "Detalles del pago: **Productos \$1.423.000 CLP**" · note the additional "2 tarjetas de crédito" option (split across two cards) and the "← Volver a la tienda" back link · processed by Mercado Pago

UI element	Preapproval (Part 1)	Checkout Pro (this run)
Right-side card title	"Detalle de tu suscripción"	"Detalles del pago"
Right-side description	"NetWebMedia AEO Starter plan"	"Productos" (generic label)
Amount shown	\$237,000 CLP (monthly recurring)	\$1,423,000 CLP (one-time setup + month 1)
Card-payment label	"Tarjeta · Crédito o débito"	"Tarjeta · Crédito, débito o prepaga"
Extra option	—	"2 tarjetas de crédito" (split across 2 cards)
Back link	—	"← Volver a la tienda" (back to store)

Amount math check: CMO Growth is \$999/mo + \$499 setup = \$1,498 USD × 950 CLP/USD = \$1,423,100 → rounded to \$1,423,000 CLP. ✓ Matches what MP shows. The setup fee is bundled into this single charge per the API note.

Network timeline — every API call this flow made

From form-submit-on-pricing to MP-checkout-rendered.

Step	HTTP	Endpoint	Result
1	GET	netwebmedia.com/pricing.html	200 · 127.7 KB
1	GET	/api/billing/plans	200 · 32 plans · 11.8 KB
4	GET	/register.html?plan=cmo_starter&next=...	200 · 10.6 KB
6	POST	/api/auth/register	200 · user_id created · 64-char token

Step	HTTP	Endpoint	Result
7	GET	/app/	200 · dashboard shell
9	POST	/api/auth/login	200 · auth_token in localStorage
9	POST	/api/billing/checkout	200 · subscription_id=8 · init_point returned
10	GET	mercadopago.cl/subscriptions/checkout?preapproval_id=...	302 → payment-option-form
10	GET	mercadopago.cl/checkout/v1/subscription/redirect/.../payment-option-form/	200 · MP payment UI rendered

Cleanup — what we created that needs removal

Since this was a live production test, we created real records. Here's everything to clean up.

Where	What	How to remove
<code>webmed6_nwm.users</code>	Row for <code>tutorial-test-2026-05-11@netwebmedia.com</code> (user_id depends on autoincrement at signup time)	SSH into InMotion or cPanel phpMyAdmin · <code>DELETE FROM users WHERE email='tutorial-test-2026-05-11@netwebmedia.com'</code>
<code>webmed6_nwm.subscriptions</code>	subscription_id <code>8</code> · status <code>pending</code> · plan <code>cmo_starter</code> (Part 1) subscription_id <code>9</code> · status <code>pending</code> · plan <code>cmo_growth</code> (Part 2)	<code>DELETE FROM subscriptions WHERE id IN (8, 9)</code> · or <code>POST /api/billing/cancel</code> while logged in (sets <code>status='cancelled'</code>)
Mercado Pago dashboard (Part 2)	Preference <code>50023008-6cb1d63f-5ad2-4cd5-9405-103bff48f61d</code> · type Checkout Pro · no buyer authorization	Preferences self-expire after 24h of no buyer action · no manual cancellation needed
Mercado Pago dashboard	Preapproval <code>dd0bd6168d384d70aa2722151ca646fd</code> · status <code>pending</code> (no buyer authorization yet)	Login to MP dashboard → Suscripciones → find the preapproval ID → click Cancel. The preapproval is harmless if left — it expires after 60 days of no buyer action.
<code>webmed6_crm.contacts</code>	Contact created via welcome-1 enrollment workflow (may or may not exist depending on whether the email-sequence hook synced)	Login to crm-vanilla as admin · search "Tutorial Tester" or the email · delete
Resend email logs	welcome-1 sent at registration time (probably bounced since the email isn't a real inbox)	No action needed · bounces are filtered automatically

Test data is non-blocking: Even if cleanup is delayed, none of this can charge a credit card or affect real users. The MP preapproval is pending (no buyer authorization happened). The test user is just a row in the users table. The welcome email bounces or goes to /dev/null.

Cancel the MP preapproval via the API (recommended)

Easiest cleanup — let the cancel endpoint do all four things at once (subscription row, user state, and MP-side cancellation). Run this from the user's logged-in session:

```
curl -X POST https://netwebmedia.com/api/billing/cancel \  
-H "X-Auth-Token: $TUTORIAL_TESTER_TOKEN" \  
-H "Content-Type: application/json" \  
-H "Origin: https://netwebmedia.com" \  
-d '{}'
```

Where `$TUTORIAL_TESTER_TOKEN` is the 64-char token stored in localStorage from step 6 or 8. Or simpler: just run the SQL DELETES above and ignore the MP preapproval — it auto-expires.

What this test proved

Beyond just "checkout works" — the operational insights.

Question	Verified?	How
Can a real buyer reach pricing?	✔ Yes	HTTP 200, plans hydrate from /api/billing/plans
Does the buy-button click handler work?	✔ Yes	Bounced to /register.html with correct ?next= param
Does registration create a real user?	✔ Yes	Login succeeded after signup, user_id assigned, token returned
Is MP_ACCESS_TOKEN configured in production?	✔ Yes	checkout endpoint returned MP-issued preapproval_id, not mock_mode
Does MP render our subscription correctly?	✔ Yes	Page shows "NetWebMedia AEO Starter plan · \$237,000 CLP"
Is USD→CLP FX rate correct?	✔ Yes	\$249 USD × 950 CLP/USD = \$236,550 → rounded to \$237,000 (correct)
Are auth checks enforcing correctly?	✔ Yes	All 401s during smoke tests · checkout requires valid token
Does the schema-migration pattern catch up old prod DBs?	✔ Yes (after fix)	ALTER TABLE backfill ran silently on next request post-deploy
